

PM Studio AI Case Study

- Problem: most AI PM portfolio projects look like generic LLM wrappers.
- Solution: an enterprise AI workspace that turns one product idea into a structured PM system.
- Core workflow: PM Agent -> Research Agent -> UX Agent -> AI Architect Agent -> Data Analyst Agent -> QA Agent.
- Output: PRD, user research, competitive analysis, AI architecture, KPIs, experiments, risks, and evaluation.

What interviewers should see

Product Thinking

- Strategic clarity: first customer, product thesis, MVP wedge, goals, and non-goals.
- User empathy: personas, JTBD, pain points, success criteria, and journey mapping.
- Market judgment: competitor categories, market gaps, and defensible differentiation.
- Scope discipline: human-in-loop MVP before high-risk automation.

AI Product Architecture

- RAG is recommended when outputs must be grounded in uploaded or private knowledge.
- Agents are used when the task requires staged reasoning, critique, and artifact synthesis.
- Human review is required for high-stakes workflows such as hiring or screening.
- Evaluation covers groundedness, unsupported claims, consistency, risk coverage, and human override rate.

How the product scales

Business Value and Roadmap

- MVP: one-sentence intake, visual agent pipeline, structured artifacts, and Markdown export.
- V1: uploaded research, RAG grounding, editable artifacts, and richer exports.
- V2: collaboration, comments, custom workflows, and live competitor research.
- Enterprise: integrations, RBAC, audit logs, evaluation datasets, and governance controls.
